| Beschreibung / Besonderheiten Nordwestlich von Baabe und direkt sudlich des Monchgabens befindet sich ein Rohrichtkomplex, der im Westen vom Selliner See, im Sudosten von Grunland und im Norden von einem Geholz an einem Graben umgeben ist. Ein Strandaster-Schilfrohricht nimmt den boddenseitig gelegenen Hauptteil ein. Das Substrat ist hier Seesand, teils mit Antorfdecke, eutroph, eben und feucht oder na bis unter Wasser. Landseitig schliet eine verschliffende aufgelassene Salzwiese an, der Untergrund ist hier antorfig, eutroph und wechselfeucht. Dieser Teil ist eine aufgelassene Weide, der Rest ist ungenutzt. Es besteht keine direkte Gefahrung, doch sollte die aufgelassene Salzwiese wieder beweidet werden, damit die teils stark gefahrdeten Salzwiesenarten nicht verdrangt werden. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
