| Als Degradationsstadium des Sauer-Zwischen-Moores auf Torfmoostorf entwickeltes Moorbirkengebüsch (mit einzelnen Kiefern, Stieleichen), das eine dichte Torfmoosschicht aufweist; Pfeifengras und Wollgrasaspekt der Krautschicht flächig abgegrenzt; Wie für Kesselmoore typisch umschließt ein schwach eutropher Randsumpf, der als Walzenseggen-StEIFseggen-Birken-Erlenbruchwald ausgebildet ist, das Moorbirkengebüsch. Schmale trocken gefallene Entwässerungsgräben durchziehen den Randbereich im Norden und Osten des Moores. Das Kesselmoor liegt in einer tiefer gelegenen Waldsenke. |  |  |  |  |  |                                                                                                                                                                        |  |  |  |  |  |  |  |                                                                                                                                                                                                                                                                                                                                                                                  |  |  |  |  |  |  |  |  |                                                                                                                                                                                                                                 |  |  |  |  |  |  |                                                                                                                                                                                                                                 |  |  |  |  |  |  |                                                                                                                                                                                                                                 |  |  |  |  |  |  |                    |  |  |  |  |  |  |
