| <b>Beschreibung / Besonderheiten</b><br>Feuchtbrache im Trebeltal auf meliorativ beeinträchtigtem Quell- und Durchströmungsmoor innerhalb der überwiegend landwirtschaftlich genutzten flachwelligen Grundmoräne von gestörtem Feuchtgrünland umgeben.<br>Auf feuchten bis sehr feuchten, mäßig degradierten Torfen hat sich infolge von Entwässerung und ehemals intensiver Grünlandnutzung ein Mosaik aus Feuchtwiesen eutropher Moor- und Sumpfstandorte in der Ausbildung als Schlankseggen-Feuchtwiese und gestörtem Feuchtgrünland als Kriechhahnenfuß-Rasenschmielen-Feuchtwiese bzw. Kriechhahnenfuß-Rohrglanzgras-Feuchtwiese herausgebildet. Aus floristischer Sicht ist das z.T. zahlreiche Auftreten von Zweizeiliger Segge und Brennendem Hahnenfuß hervorzuheben. Zum Erhalt und zur Wiederherstellung eines artenreichen Feuchtgrünlandes ist neben der Fortführung der extensiven Grünlandnutzung auch eine Einschränkung der Entwässerung anzustreben. |   | <b>Wertbestimmende Kriterien</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |   | Artenreichtum (Flora)          |                                                | vielfältige Standortverhältnisse   |                                   | Vorkommen seltener / typischer Tierarten |              | historische Nutzungsformen    |             | X seltener / gefährdeter Pflanzenbestand |            | aktuelle Nutzung              |                  | seltene / gefährdete Pflanzengesellschaft |                  | Flächengröße / Länge          |  | natürliche / naturnahe Ausprägung des Biotops |  | Umgebung relativ störungsarm  |  |  |  |  |  |  |                                                                                                                                                                                                                                                                                                                                                                    |  |                               |   |                               |   |                               |   |                               |                                                                                                                                                     |                               |   |                               |   |                                                                                                                                         |  |   |   |   |                                                                                                                                                   |  |   |   |   |   |
