| <b>Beschreibung / Besonderheiten</b><br>Brackwasserröhricht an der Ostseeküste südlich der Großen Strandwiese. Die Röhrichtabschnitte sind lückig und teilweise von salzbeeinflussten Hochstaudenfluren und Fluren der Dünen durchsetzt. Die Vegetation unterliegt stark dem Einfluß der Seebewegung und kann sich in seiner Zusammensetzung immer wieder verändern.                                                  |  |                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |                                                                                  |  |
