| Kleiner Silbergras-Schafschwingel-Magerrasen auf einer Ackerbrache nordöstlich Alt Schlagsdorf. Östlich des Magerrasens befindet sich eine alte Kiesgrube. Der teilweise lückige Magerrasen weist stellenweise größere Bestände der Sandstrohlume auf. Das Substrat bilden nährstoffarme Sande. Langfristig mußte eine extensive Schafbeweidung erfolgen, um den Offencharakter und das Artenspektrum zu erhalten. |  |  |  |  |  |                              |  |  |  |  |  |                                          |  |                                           |  |  |  |                          |                            |  |                            |  |  |     |  |          |  |  |  |                    |  |  |  |  |  |
