| Beschreibung / Besonderheiten Artenreiche Wiesenvegetation bei feuchten Bodenwasserverhältnissen. Groß- und Mittelseggen (Wiesenseggen) bilden eine vertikal strukturierte Gemeinschaft, darin sind Blutwurz und Wiesensegge besonders erwähnenswert. Weiter südlich haben sich verschilfte Sumpfschilf- und Rohrgrasbestände herausgebildet. Diese Brachetypen sind artenärmer und neben Sumpfschilf und Rohrgras vor allem aus Waldreitgras, Großer Brennnessel und Wasserminze aufgebaut. Die Umgebung ist großflächig von Staudenfluren unterschiedlicher Wasserstufen geprägt. Randlich, nah am Biotop verläuft ein Fanggraben. Oberhalb des Biotop stockt Mischwald. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
