| Ein nasser Erlenbruchwald, der in den Randbereichen und im mittleren Bereich in einen Erlen-Eschenwald übergeht. Hervorzuheben ist die naturnahe Ausprägung. Der am SO vorhandene Graben ist flach und beeinträchtigt das Gebiet wenig, sollte aber trotzdem verschlossen werden. Vor allem im Südteil gibt es einige 60 cm dicke Silberweiden, die Höhlen aufweisen. |  |  |  |  |  |                                                                                                       |  |  |  |  |  |  |                                         |                                                                                                                   |  |  |  |  |  |  |  |                                                                                                           |  |                          |  |  |  |  |  |
