| Flurstück mit Feuchvegetation am Westufer der Tollense. Über sehr nassem, eutrophem Torf liegt im flachem Gelände nahe der Tollense ein rasiges Seggenried aus Sumpfsimse vor, das von Flußampfer, Sumpfziest und Rasenschmiele durchsetzt wird. Nach Norden geht dieses in ein bultiges Rispeseggenried über, bevor ein als Feldgehölz kartierter, entwässerter Brennessel-Erlenwald anschließt. Im Westen des Seggenriedes liegen Grauweidenbüsche teilweise über offenem Wasser vor. Nach Süden, zur Tollense folgt ein eutrophierter, Brennessel-dominierter Bereich (nicht kartiert). Die im Osten und Westen an das Biotop angrenzenden Flächen werden gedüngt und gemäht (Intensivgrünland), durch den Nährstoffeinfluß können randlich Brennesselsäume ausgebildet sein. Das Biotop wird an seiner Süd- und Westseite von einem Graben umgeben (Wasserlinsen). |  |                                                                                                                                                  |  |                                                       |  |     |  |                                                                                                                                                 |  |                                                                                                                                                 |  |                                          |  |                                                                                                                                                 |  |                                                          |  |  |  |  |  |  |  |
