| Beschreibung / Besonderheiten In einer flachen anmoorigen Senke im Südwesten eines größeren Laubmischwaldes nordöstlich von Testorf stockt auf sehr feuchtem eutrophen Antorf ein moosreicher Winkelseggen-Eschen-Flatterulmenwald. Die Krautschicht ist nur spärlich entwickelt. Schwarzerlen sind ebenfalls beigemischt (Erle und Esche jedoch < 30 %). Auffällig ist auch der Moosbewuchs an den Baumstämmen (am Stammfuß). Desweiteren treten in der Krautschicht Großseggen, Frauenfarn und Schwertlilie auf. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
