| Erlen-Birkenbruchwald mit vorgelagerten Weidengebüschen in einer Niedermoor senke in kuppiger Endmoräne nördlich Paarsch. Auf überwiegend sehr feuchtem, allerdings durch die Entwässerungswirkung eines alten Randgrabens nun degradiertem Torfboden, stockt ein überwiegend jüngerer Schwarz-Erlenbestand, durchsetzt mit ebenfalls jüngeren Moorbirken. In der nur gering ausgeprägten Strauchschicht dominiert der Schwarze Holunder. Die stark entwickelte Krautschicht weist noch typische Bruchwaldarten, wie Sumpf-Haarstrang, Wasser-Schwertilie und Gem. Helmkraut auf, zeigt aber bei der Dominanz der Gr. Brennessel die Tendenz zum Brennessel-Erlen-Bruchwald. Nach Süden hin vorgelagert befinden sich artenarme Grauweiden-Lorbeerweiden-Gehölze sowie Brennessel-Grauweiden-Gebüsche. In Zusammenhang mit der Melioration des Roten Baches und der damit verbundenen Grundwasserabsenkung dürfte auch dieses Biotop, welches durch ein Grabensystem verbunden ist, entwässert worden sein. |  |  |  |  |  |                                                                                                                                                                                                                                                                            |  |  |  |  |  |                                        |  |                                                                                                                                                                                      |  |  |  |                          |  |            |  |  |  |  |  |
