| <b>Beschreibung / Besonderheiten</b><br>Innerhalb der großen vermoortten Niederung der Dobbertiner Platte befindet sich ein überwiegend von Gebüsch besiedelter flacher Rücken. In seinem Ostteil hat sich auf eutrophem überwiegend feuchtem Antorf ein Sumpfschilf-Ried entwickelt. Nach Westen schließt sich ein Sumpfschilf-Röhricht an. Der Biotop ist ca. 220 m² groß, wird von Ruderalflur und Gebüsch umgeben und ist eben bis leicht nach Süd geneigt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
