| <b>Beschreibung / Besonderheiten</b><br>Ein verlandeter Torfstich befindet sich rund 1100 m nordwestlich von Neddemin auf der "Treptower Wiese", umgeben von aufgelassenen Talmoorbereichen und anderen Torfstichen (fast angrenzend Biotop Nr. 4019). Auf großflächig nassen bis sehr feuchten, eutrophen Torfen ist im südlichen Biotopteil überwiegend ein Grauweidenbüsch mit Sumpf- und Ufersegge, reichlich Moosen und vereinzelt Erlen zu finden. Nur kleinflächig im Zentrum liegen offene Bereiche mit einem Schilfröhricht, das vom Breitblattröhrlkolben und der Rispensegge durchsetzt ist. Im nördlichen Teil ist das Verhältnis der beiden Vegetationseinheiten umgekehrt: große Röhrichtbereiche im Zentrum werden von einem schmalen Feuchtgebüschaum umgeben. Am Rande treten auch feuchte Bereiche auf. Hier ist der Erlenaufwuchs offensichtlicher. Im Norden und Süden verläuft je ein Weg, ansonsten grenzen Staudenfluren und Gehölze auf degradiertem Niedermoortorf an sowie im Osten ein Torfstichgewässer und Biotop Nr. 4019. Weiter westlich befindet sich eine noch genutzte Wiese.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |           |
