| In der vermoorten Niederung eines begradigten Baches wächst auf feuchtem Standort eine fragmentarisch ausgebildete Feuchtwiese. Sie wird von Sumpf-Segge und Kriechendem Hahnenfuß bestimmt. Stellenweise treten Waldsimse oder Zweizeilige Segge stärker in Erscheinung. Die Feuchtwiese ist mit nicht geschütztem Grasland verzahnt. Die gesamte Niederung wird durch zahlreiche Gräben entwässert. |  |  |  |  |  |                                                                                                                                                                                              |  |  |  |  |  |                                                       |                                                                                                                                                                                             |  |  |  |  |                                                     |              |                                                                     |                                                                                                                                                                                             |  |  |                                                                           |  |  |          |  |  |  |          |
