| Auf süd- und südwestexponiertem Flachhang befindet sich südwestlich von Klein Trebbow am Rande des Klätowbruchs ein relativ artenarmer Trockenrasen. Mosaikartig mischen sich Sandmagerrasen (Feldbeifuß-Schafschwingelflor und Kleiner Sauerampfer-Rotstraußgrasflur) mit Pioniersandfluren (Silbergrasflur). Offenbodenbereiche sind eingestreut und nehmen maximal 10% der Fläche ein. Der Trockenrasen wird mit Rindern beweidet. Es handelt sich um einen trockenen, meist oligotrophen Sandstandort. Zum Aufnahmezeitpunkt war die Vegetation infolge einer Dürre zum großen Teil vertrocknet. Nördlich und westlich des Biotops verlaufen Feldwege, im Osten ein Graben. Es ist von Extensivgrünland umgeben (ebenfalls beweidet oder gemäht). |                                               |  |  |  |  |                                                                                                                                                                                                                                                                                                                    |  |  |  |  |  |  |  |                            |  |                          |  |            |  |  |  |
