| Beschreibung / Besonderheiten Südlich von Goldenbaum befindet sich inmitten von Weideland ein kleiner, von dichten Grauweidengebüschen umgebener See. Die Grauweidengebüsche waren zum Aufnahmezeitpunkt hoch eingestaut. Westlich des Sees entwickelte sich inmitten der Grauweidengebüsche eine Schwingmoordecke mit einem Torfmoos-Schilf-Birkenwald. Durch den Anstieg des Wasserspiegels war dieser stark vernässt. In der Krautschicht waren Faden-Segge, Schnabel-Segge und Sumpf-Blutauge entwickelt. Die hoch eingestauten umgebenen Weidengebüsche zeigten flutende Wasserschlauch- und Sumpfbloaugen-Bestände. Die Schwingdecke war nicht bis zur Seekante begehbar. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
